ACC WRESTLING CHAMPIONSHIP

2026 — Machine Learning Prediction Results

Official Post-Tournament Evaluation Report

■ OVERALL CHAMPION PREDICTION RESULTS

Weight	Predicted	Actual Champion	School	Consensus	Agree%	Result
125 lbs	Eddie Ventresca	Eddie Ventresca	Virginia Tech	Unanimous	85.7%	■ CORRECT
133 lbs	Aaron Seidel	Aaron Seidel	Virginia Tech	3/4 Models	85.7%	■ CORRECT
141 lbs	Gable Porter / Ryan Jack	Jack Consiglio	Stanford	Split Decision	57.1%	■ UPSET
149 lbs	Koy Buesgens	Collin Gaj	Virginia Tech	Unanimous	85.7%	■ UPSET
157 lbs	Daniel Cardenas	Daniel Cardenas	Stanford	Unanimous	90.5%	■ CORRECT
165 lbs	Will Denny	Bryce Hepner	North Carolina	Unanimous	81.0%	■ UPSET
174 lbs	Matthew Singleton	Matthew Singleton	NC State	3/4 Models	71.4%	■ CORRECT
184 lbs	Jake Dailey	Jaden Bullock	Virginia Tech	3/4 Models	66.7%	■ UPSET
197 lbs	Sonny Sasso / Mac Stout	Sonny Sasso	Virginia Tech	Split Decision	76.2%	■ CORRECT
285 lbs	Isaac Trumble	Isaac Trumble	NC State	Unanimous	76.2%	■ CORRECT

Champion Prediction Accuracy: 6/10 weight classes correct (60%) | Models correctly predicted **6** of **10** ACC champions.

■ OVERALL MODEL ACCURACY — ACC Tournament (Regular & All Matches)

Model	Regular Correct	Regular Total	Regular Accuracy	All Matches Correct	All Matches Total	All Matches Accuracy
Logistic Regression	72	101	71.3%	76	107	71.0%
Decision Tree	70	101	69.3%	74	107	69.2%

XGBoost v1 (no ranks)	74	101	73.3%	78	107	72.9%
XGBoost v2 ★ Best	**77**	**101**	**76.2%**	**81**	**107**	**75.7%**

Regular matches exclude DQ, Injury Default, and Forfeit outcomes. **All matches** includes every match regardless of how it ended.

■ METHODOLOGY: MACHINE LEARNING MODELS & MATCH TYPES

The Four Prediction Models

MODEL 1 — LOGISTIC REGRESSION (BASELINE)

Logistic Regression is the simplest of the four models and serves as an interpretable baseline. It finds a best-fit boundary through historical win/loss data using a single input feature — **win_rate_diff** (home wrestler win rate minus away wrestler win rate) — and applies a sigmoid function to output a probability between 0 and 1. If a wrestler has a meaningfully higher win rate, this model will predict them to win. Its strength is transparency: you can directly see why it predicts what it does. Its weakness is that it cannot capture complex, non-linear patterns in the data.

MODEL 2 — DECISION TREE (33 FEATURES)

A Decision Tree learns a series of if/else rules from the training data — at each node it picks the feature that best separates winners from losers. This naturally handles non-linear relationships and feature interactions, and you can trace exactly why any given prediction was made. It uses 33 features including win rate, bonus rate, pin counts, average point differentials, whether the wrestlers have met before, and academic class/weight class encodings. The downside: trees can overfit to training data if not properly constrained.

MODEL 3 — XGBOOST v1 (33 FEATURES)

XGBoost builds an ensemble of decision trees sequentially — each new tree is trained to correct the prediction errors of the trees that came before it. This "gradient boosting" approach captures complex, non-linear feature interactions that a single tree or logistic regression would miss, handles missing data natively, and tends to be highly accurate. It uses the same 33 features as Model 2. XGBoost is one of the most consistently powerful algorithms in competitive machine learning and real-world prediction tasks.

MODEL 4 — XGBOOST v2 ★ BEST MODEL (34 FEATURES) 34 Features

Same XGBoost algorithm as Model 3, but with one critical additional feature: **team_rank_diff** — the difference in national team rankings between the two wrestlers' programs. This single addition captures signals invisible in individual stats: coaching quality, depth of daily training competition, program resources, and recruiting strength. A wrestler from a nationally top-ranked program is likely battle-tested against elite competition every practice. This contextual information gives XGB v2 its edge, and it was the designated best model throughout the prediction process.

Understanding Match Types

Match Type	Category	Decision Subtypes	Included in ML Evaluation?
Decision (Dec)	REGULAR	Standard 3-period decision	■ YES
Major Decision (MD)	REGULAR	Win by 8–14 points	■ YES
Technical Fall (TF)	REGULAR	Win by 15+ points	■ YES
Fall / Pin	REGULAR	Wrestler pinned to the mat	■ YES
Sudden Victory (SV)	REGULAR	OT sudden death period	■ YES
Tiebreaker (TB)	REGULAR	Riding time tiebreaker period	■ YES
Disqualification (DQ)	SPECIAL ■■	Rule violation / unsportsmanlike	■ EXCLUDED

Injury Default (Inj)	SPECIAL ■■	Wrestler unable to continue	■ EXCLUDED
Forfeit	SPECIAL ■■	Wrestler does not compete	■ EXCLUDED

Why exclude Special matches? The ML models were trained exclusively on matches that ended through genuine competition — a wrestler out-wrestling their opponent. Disqualifications, injury defaults, and forfeits do not reflect true athletic matchup outcomes, so they are excluded from accuracy evaluation to avoid distorting model performance metrics. Both "Including All" and "Regular Only" accuracy figures are reported for transparency.
