IVY LEAGUE WRESTLING CHAMPIONSHIP

2026 — Machine Learning Prediction Results

Official Post-Tournament Evaluation Report

■■ 285 LBS WEIGHT CLASS — LATE ROSTER SUBSTITUTION

Princeton's Sebastian Garibaldi (for whom all predictions were generated) was replaced at the last minute by Anderson Olcott, an entirely different competitor with different stats. Olcott competed in 3 matches during the tournament. Because no predictions exist for Olcott, those 3 matches are **completely excluded** from all evaluation — they are not counted as regular or special matches, and do not factor into any accuracy metrics.

■ OVERALL CHAMPION PREDICTION RESULTS

Weight	Predicted	Actual Champion	School	Consensus	Agree%	Result
125 lbs	Marc-Anthony McGowan	Marc-Anthony McGowan	Princeton	Unanimous	80.0%	■ CORRECT
133 lbs	Evin Gursoy	Tyler Ferrera	Cornell	Split Decision	86.7%	■ UPSET

Champion Prediction Accuracy: 8/10 weight classes correct (80%)

■ OVERALL MATCH-LEVEL MODEL ACCURACY (Ivy League Tournament)

Model	Reg Correct	Reg Total	Reg Acc	All Correct	All Total	All Acc
Logistic Regression	69	86	80.2%	69	87	79.3%
Decision Tree	68	86	79.1%	68	87	78.2%
XGBoost v1 (no ranks)	69	86	80.2%	69	87	79.3%
XGBoost v2 ★ Best	**64**	**86**	74.4%	**65**	**87**	74.7%

Regular = excludes injury default (184 lbs 3rd Place) and the 3 Anderson Olcott substitution matches at 285 lbs.

■ METHODOLOGY: MACHINE LEARNING MODELS & MATCH TYPES

The Four Prediction Models

MODEL 1 — LOGISTIC REGRESSION (BASELINE)

Logistic Regression is the simplest of the four models and serves as an interpretable baseline. It finds a best-fit boundary through historical win/loss data using a single input feature — **win_rate_diff** (home wrestler win rate minus away wrestler win rate) — and applies a sigmoid function to output a probability between 0 and 1. If a wrestler has a meaningfully higher win rate, this model predicts them to win. Its strength is transparency; its limitation is that it cannot capture complex, non-linear patterns.

MODEL 2 — DECISION TREE (33 FEATURES)

A Decision Tree learns a series of if/else rules from data — at each node it picks the feature that best separates winners from losers. This naturally handles non-linear relationships and you can trace exactly why any prediction was made. It uses 33 features including win rate, bonus rate, pin counts, average point differentials, whether the wrestlers have met before, and academic class/weight class encodings.

MODEL 3 — XGBOOST v1 (33 FEATURES)

XGBoost builds an ensemble of decision trees sequentially — each new tree is trained to correct the errors of the trees before it. This gradient boosting approach captures complex, non-linear feature interactions, handles missing data natively, and tends to be highly accurate. It uses the same 33 features as the Decision Tree. XGBoost is one of the most consistently powerful algorithms in competitive machine learning.

MODEL 4 — XGBOOST v2 ★ BEST MODEL (34 FEATURES) 34 Features

Same XGBoost algorithm as Model 3, with one critical additional feature: **team_rank_diff** — the difference in national team rankings between the two wrestlers' programs. This captures coaching quality, depth of daily training competition, program resources, and recruiting strength — contextual signals invisible in individual statistics alone. A wrestler from a top-ranked program is likely battle-tested against elite competition every single practice.

Match Types: Regular vs. Special

This tournament had two categories of match outcomes. **Regular matches** (Decision, Major Decision, Technical Fall, Fall/Pin, Sudden Victory, Tiebreaker) ended through genuine head-to-head competition and are included in accuracy evaluation. **Special matches** — specifically one **Injury Default** in the 184 lbs 3rd-place match — did not end through one wrestler out-wrestling the other and are excluded from the "Regular Matches Only" accuracy figures. Both figures are reported for transparency.

Additionally, the **285 lbs weight class** presented a unique edge case: Princeton's Sebastian Garibaldi was replaced last-minute by Anderson Olcott. The three matches Olcott competed in are **entirely excluded** — not classified as regular or special — because no predictions exist for him. This is distinct from a Special match; it is simply an unpredictable roster change that makes evaluation impossible for those bouts.
